

# FT6800 Load (2.6 kW...52 kW)

## High-power Programmable DC Electronic Load

FT6804A 2.6 kW/100A/500V

- Voltage range: 40 V, 120 V, 500 V, 800 V, 1000 V, 1200 V;
- Current range: 2400A max. per unit;
- Rated power: 2.6kW, 4kW, 5.2kW, 8kW, 12kW, 16kW, 20kW, 24kW, 28kW, 32kW, 36kW, 42kW, 48kW, 52kW, max. 300kW (parallel);
- CC, CV, CR, CP, CV+CC, CR+CC modes;
- Dynamic frequency up to 20kHz;
- Ultra high precision V & I measurement;
- Store and recall up to 20 groups setups;
- Flexible triggering options via front panel, external input, or bus (used for transient, sequence, automatic test);
- Adjustable CV loop speed test, match different power supplies;
- Programmable sequence , automatic test;
- OCP test, super capacitor test, battery test;
- Short circuit simulation;
- Voltage-on (Von) & voltage-off (Voff) latch operation and timer unloading;
- Analog interfaces provides current programming and voltage/current monitoring;
- ±OVP, ±OCP, ±OPP, OTP, ±current limit;
- Standard RS232, USB (serial), LAN, optional GPIB interface;
- SCPI and ModBus RTU protocol;

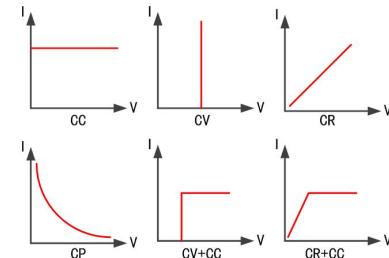

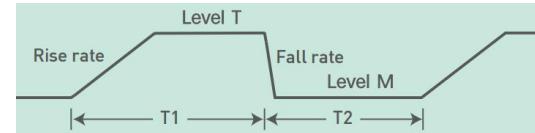

### General

FT6800 series high-power programmable DC electronic load is a multi-functional, large-capacity electronic load product designed with the principle of high reliability and high stability. FT6800 series has the advantages of fast transient response, high precision (0.05% accuracy), capability of low voltage operation at full scale current, they are widely used in testing and evaluating a variety of DC sources such as DC-DC converters, power batteries, solar cell array, BMS, charging piles, charging pile modules, vehicle On Board chargers (OBC), high-power switching power supplies, telecom power supply, vehicle power supply, super capacitor, etc.

For bench top applications, this series provides an intuitive user interface with full keypad and rotary knob. System integrators benefit from the standard USB (virtual SERIAL), RS232 and LAN interfaces supporting both SCPI commands and ModBus RTU protocol. The optional Windows application software allows users to control the electronic load, execute various tests such as sequence test, automatic test, dynamic test, static test, OCP/OVP/OPP test, battery discharging test etc..

**FT6800 Series (2.6 kW...52 kW)****Transient test**

Modern electronic devices operate at very high speeds and demand rapid transient response characteristics. To address these applications, the series offers high speed, programmable dynamic current loading. The figure shown below exhibits the programmable parameters such as current high/low level, T1/T2, rise/fall rate. The dynamic loading supports continuous, pulse, and toggle modes. When configured as pulse or toggle mode, the load accepts a trigger signal via front panel, external input, or bus, which allow the dynamic load behavior to be synchronized with other events. The max. current rise rate is 60 A/ $\mu$ s and the dynamic change is up to 20kHz.

**Static test**

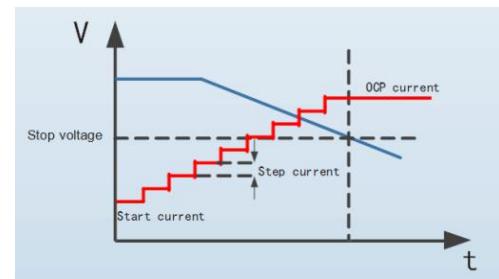

In addition to the basic test modes of CC, CV, CR, CP, the series load provides users with CV+CC and CR+CC complex modes to meet comprehensive test requirements (complex modes are unavailable for 40V voltage models).

**Programmable sequence test**

All models provides users with a programmable sequence function to simulate various load input changes. The sequence feature allows users to program a list of steps to the electronic load's internal memory and execute them. A total of 50 steps can be allocated to each internal memory location, up to a maximum of 20 locations (sequences). The test sequence can be programmed locally through the keypad and rotary knob, also it can be programmed remotely via the USB, GPIB, or LAN interfaces using SCPI commands with the included application software. Each steps' settings include operate mode (CC/CV/CR/CP), range, load value, step time (0.0001 ~ 90000 seconds), rise slew rate, fall slew rate. Sequence files can be run continuously, or by trigger signal.

**OCP test**

All models provides OCP test feature, which enables the user to set current orders to test overcurrent protections, also to judge the test result as Pass or Fail on electronic load. The maximum current ( $I_{max}$ ) during testing can be captured and showed on the display without using an oscilloscope to verify the correctness of designed overcurrent. It can save a lot of testing time for the user. Furthermore, users can collaborate with remote control software to conduct OCP/OVP/OPP test.

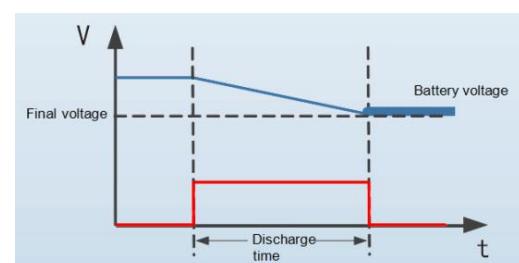

**Automatic test**

The automatic test feature allows users to program a list of steps to the load's internal memory and execute them. A total of 50 steps can be allocated to each internal memory location, up to a maximum of 20 locations (test files). The test file can be programmed locally through the keypad and rotary knob, also it can be programmed remotely via the USB, GPIB, or LAN interfaces using SCPI commands with the included application software. Each steps' settings include operate mode (CC/CV/CR/CP), range, load value, step time (0.2 ~ 25.5 seconds), short circuit status (ON/OFF), judge parameter (OFF / V / I / P), lower limit, upper limit. The load can compare the test parameters with corresponding upper and lower limits, and display the test results in the form of NG/GO. This feature greatly improves the test efficiency.

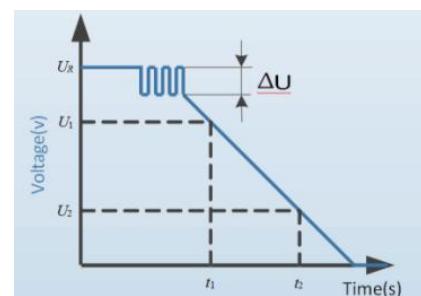

**Battery internal resistance and capacity test**

Internal resistance test adopts constant current discharging method.

For battery capacity test, it adopts transient current discharging, in which the discharging current is switching between main value (LEVEL M) and transient value (LEVEL T). When transient current LEVEL M equals LEVEL T, it turns into constant current discharging method. Users can set cut off voltage, discharging current (LEVEL M & LEVEL T), discharging time (WIDTH M & WIDTH T) for capacity test.

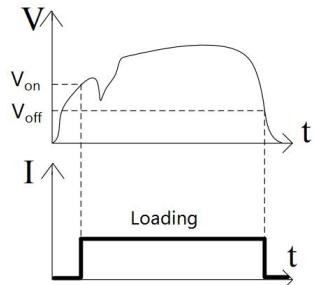

**Super capacitor test**

The series can test the internal resistance and capacity of the super capacitor at the same time. You can test the super capacitor by setting the discharge current, cut off voltage, and the start/end points of the capacity calculation. The test terminates when the super capacitor voltage drops to cut off voltage, the capacity and ESR value of super capacitor will be displayed on the TFT screen.

**FT6800 Series (2.6 kW...52 kW)****Master-slave parallel**

For increased power and current, two or more loads can be run in parallel to achieve the desired power and load current. All models provides the user with smart Master-Slave parallel controls, which enables the user to program the load currents of the Master unit and have them automatically calculated and distributed to the slave loads. Using several loads in parallel to simulate a single load dramatically simplifies the operation. All models of the series can be integrated into a 19" width standard rack to save space, as well as controlled and reconfigured with automated testing applications via standard RS232 and GPIB interfaces.

**Voltage-on (Von) & voltage-off (Voff) latch operation and timer unloading**

In static mode (CC, CV, CP and CP) operation, users are able to control the input turn on/off state for the DC electronic load by configuring the Von/Voff latch function. Also this series provides users with a timer unloading function, the electronic load automatically turns off loading when time finishes.

**Low voltage operation**

The FT6800 series can operate at low voltages for high current applications such as testing of superconducting material, solar cell, fuel cell, CPU power supply circuit, etc..

FT6826N	FT6840N	FT6880N	FT68120N
0.2V/400A	0.2V/600A	0.3V/1200A	0.3V/1500A

**Protective features**

For protection of the equipment connected, it is possible to set an overvoltage protection threshold (OVP), as well as one for overcurrent (OCP) and overpower (OPP). As soon as one of these thresholds is reached for any reason, the loading will be immediately shut off and a status signal will be prompt on the display and via the interfaces. There is furthermore an overtemperature protection (OTP), which will shut off the loading if the power supply overheats.

**External analog programming and monitoring**

In addition to front panel and remote interface control, current values can also be programmed from 0...100% with an analog control signal of 0 V...10 V (available in CC mode only). To monitor the input voltage and current, there are analog outputs with 0 V...10 V.

**Digital interfaces**

In addition to the local controls through full keypad rotary knob, there are standard remote control interfaces such as USB, RS232 and LAN interfaces. USB, RS232 and LAN can be used to control and monitor the devices either with SCPI language commands or ModBus RTU protocol, while with GPIB only SCPI is supported.

**Optional control software**

Faithtech provides an optional control software for Windows PCs, which allows for the user to remotely control the power supply, execute various tests such as sequence test, automatic test, dynamic test, static test, OCP/OVP/OPP test, battery discharging test. Furthermore, the control software allows user to conduct parallel operations (Software parallel operations are available via RS232 and GPIB interfaces ONLY).

**Options**

FT68001A graphical visualization control software FaithLoad;

AC load rectifier accessories.

## FT6800 Series (2.6 kW...52 kW)

Dimension	440(W)×420(H)×680(D)													
Temperature	Protection temperature 85°C, working temperature 0~40°C, full power operation temperature 0~25°C													

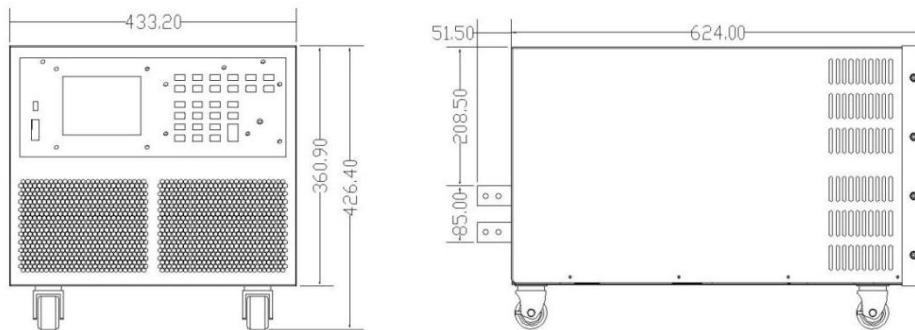

## FT6800 Series (2.6 kW...52 kW)

**Dimension \***

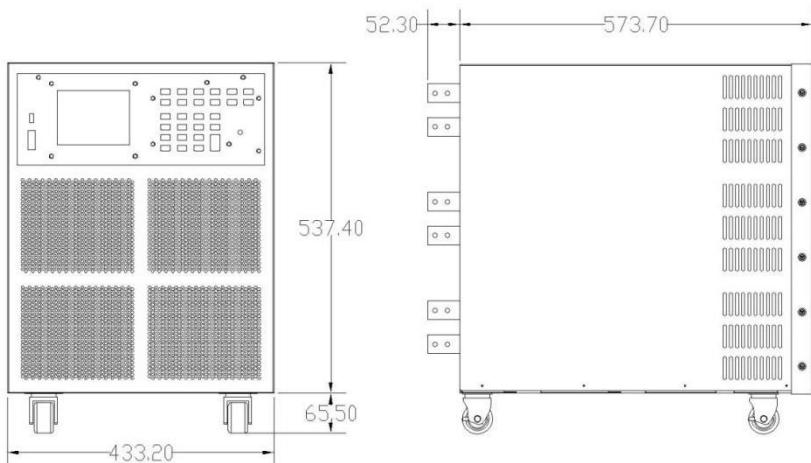

2.6kW~4kW model dimension

5.2kW~8kW model dimension

12kW model dimension

\* Specifications are subject to changes without notice.
